JMeter 操作说明

通过JMeter模拟并发的http请求,测试自己编写的服务器 性能测试只需要对题目1.1实现的Web Server进行测试

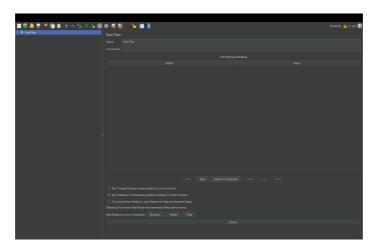

步骤:

- 1. 下载JMeter: http://jmeter.apache.org/download_jmeter.cgi
 - mac/linux 下载tgz
 - windows 下载zip

2. 解压 进入到bin文件夹

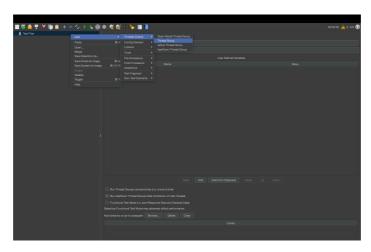

- windows: 运行jmeter.bat
- mac/linux: cd bin; bash jmeter;

3. 进入如下界面

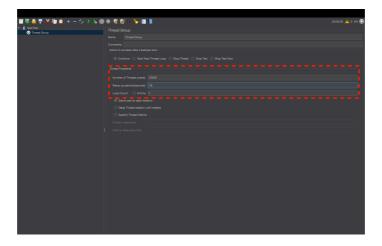

性能测试使用JMeter对服务器进行压测,性能测试的指标为服务器每秒能够处理的的响应请求数,即QPS。

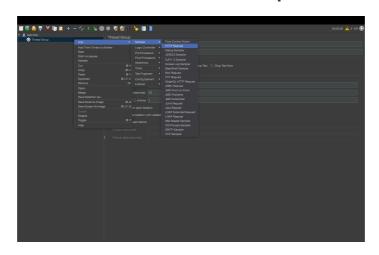

4. 在默认测试计划上右键创建线程组 (Add --> Threads(Users)--> Thread Group)

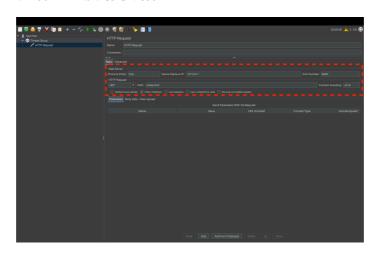

5. 设置线程数和启动期,具体参数可参考后面的表格,循环1次

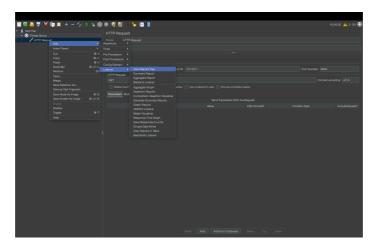

6. 在该线程组上右键设置请求协议为HTTP(Add --> Sampler --> HTTP Request)

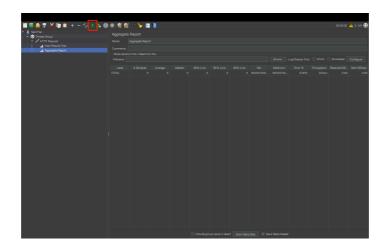

7. 配置请求的目标地址和端口以及请求路径

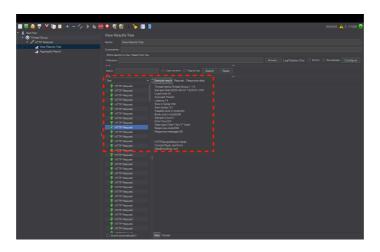

8. 为测试计划右键添加监听统计信息(Add --> Listener --> View Results Tree & Aggregate Report)

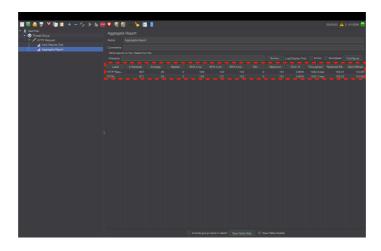

9. 运行服务器并启动测试

10. View Results Tree可查看每笔请求的状态

11. Aggregate Report可查看聚合的结果报告

12. 测试要求请求index.html, 测试error%和throughput

| 测试参数 | 数值 |
|--------------------|-------------------------------------|
| 响应的body长度 | 约100 bytes |
| Number of Threads | 1000 / 2500 / 10000 / 25000 or more |
| ramp-up period (s) | 10 |
